Last Operator Set Keyframe Interpolation.....	4
Type.....	4
Keyframe Type.....	4

### Introduction

The header contains various menus and tools. This chapter here is about the tools, modes and options elements in the header.

The text menus are covered in a own chapter each. They vary too much, dependent of mode and object type.

### Header Tabs

The tabs at the very left allows you to switch between the four most important editor types by one click. Dope sheet Editor, Graph Editor, Driver Editor, NLA Editor.

### Use Normalization, Create Ghost Curves

## Use Normalization

Normalizes the curves so that the maximum does not exceed 1 and the minimum does not go lower than -1

## Auto Normalization

Automatically recalculate curve normalization when you modify the curve.

## Create Ghost Curves

Creates a snapshot of the current curves, and displays it as a background image in the viewport. This background image is not permanent, and will be deleted when you close Bforartists.

When a ghost background image is created then the button turns into a delete button with which you can remove the ghost image.

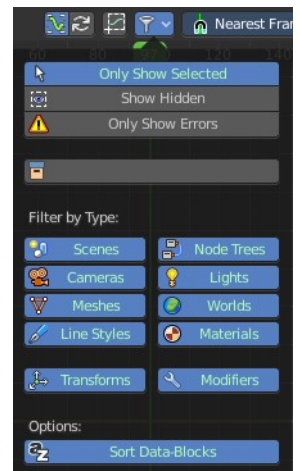

# Filters

The Filters panel allows you to filter out elements.

Note that in other modes the panel does not show all content. In Action Editor mode for example it just shows the first four elements.

## Only Show Selected

Display only the data for the selected object in the list of elements. If off it displays all available animation data of the whole scene.

## Show Hidden

Include channels from objects / bones that are not visible. This feature just works with Only Selected off.

## Only Show Errors

Only display F-Curves and Drivers that have errors or are disabled.

## Filtering Collection

Just display the content from the chosen collection in the list of elements.

## Filter by Type

In this section you can choose what type of animation data should be displayed. The names should be self explaining.

## Options

### Sort Data Blocks

Alphabetically sort the data in the list of elements.

## Auto Snap

Adjust how the selected keyframe or fcurve point snaps to other elements.

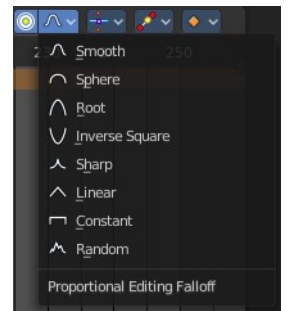

## Proportional Editing

Enable proportional editing.

Proportional editing allows you for example to scale two keyframes and influence the not selected neighbor keyframes in a proportional way. Or the proportional editing of fcurve points.

The drop down menu to choose the proportional editing falloff method is just available when the proportional tool is active.

## Easing Mode, Keyframe Handle Type, Keyframe Interpolation, Keyframe Type

### Easing Mode

The easing methods in the interpolation mode menu are for the easing shape. This menu allows you to choose an easing method.

### Last Operator Set Keyframe Easing Type

#### Type

Set the easing type.

## Keyframe Handle Type

Set the handle type for the currently selected keyframes.

This is a feature for the Graph editor, where each curve point has its own handler with which you can influence the curve behavior. But the handler type also influences how the animation curve acts at the chosen keyframes. So it has its use in the dope sheet editor too.

## Last Operator Set Keyframe Handle Type

### Type

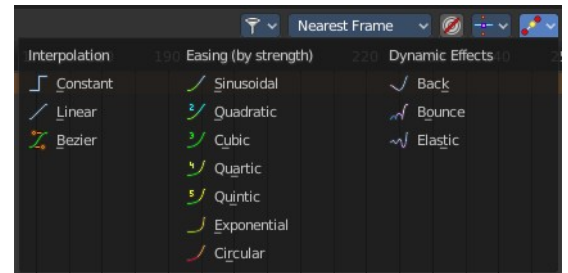

Set the handle type for the currently selected curve point.

## Keyframe Interpolation Mode

The Interpolation mode defines how the curve acts from keyframe to keyframe. You can have a linear curve between two keyframes instead of a bent one for example.

The easing methods here in the interpolation mode menu are for the easing shape. There is also an easing menu where you can choose a easing method.

## Last Operator Set Keyframe Interpolation

### Type

Set the interpolation mode.

## Keyframe Type

Recolor the currently selected keyframes. Or create the next keyframe with this chosen keyframe color.

This menu has no use in the Driver editor. It is a Dope Sheet editor tool set.
