Add menu - Mesh

Nodes to modify the mesh geometry.

Dual Mesh

The Dual Mesh node calculates the dual of the input mesh. This means that faces get replaced with vertices and vertices with faces.

Inputs

Mesh

The input mesh.

Keep Boundaries

Keep the (non-manifold) boundaries of the mesh intact.

Outputs

Dual Mesh

The output mesh.

Edge Paths to Curves

Converts Edge Paths to Curves.

Inputs

Mesh

The input mesh.

Start Vertices

The start vertices of the edge path.

Next Vertex Index

The edge path by index.

Outputs

Curves

The output curve.

Edge Path to Selection

Calculates an edge path, and converts it to a selection

Inputs

Start Vertices

The start vertices of the edge path.

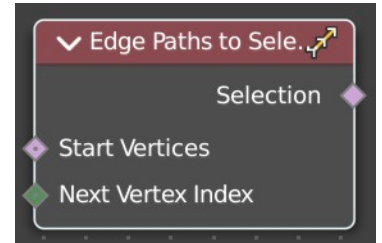

Next Vertex Index

The edge path by index.

Outputs

Selection

The selection

Extrude Mesh

Extrudes out geometry at the selection by a given amount.

Inputs

Mesh

The input mesh.

Selection

A selection of the mesh.

Offset

The offset amount.

Offset Scale

The offset scale. Without an offset this is equal the amount.

Individual

Just Faces mode. Extrude out individual faces.

Properties

Mode

What kind of elements to extrude out. Vertices, Edges or Faces.

Outputs

Mesh

The output mesh.

Top

The top elements of the extrusion.

Side

The side elements of the extrusion.

Flip Faces

Flips the winding order of the selected faces.

Blender developers decided not to call it Flip Normals. Since "normals are derived data, changing them is only a side effect." However, what the node does is in fact to flip the normals.

Inputs

Mesh

The input mesh.

Selection

A selection of the input mesh.

Outputs

Dual Mesh

The output mesh.

Mesh Boolean

The Boolean Node allows you to cut, subtract, and join the geometry of two inputs. This node offers the same operations as the Boolean modifier.

Inputs

Geometry 1, 2

Standard geometry input.

Self Intersect

Allow self intersection.

Hole Tolerant

Allow holes.

Properties

Operation

The boolean operation.

Intersect

Produce a new geometry containing only the volume inside of both geometry 1 and geometry 2.

Union

The two input pieces of geometry are joined, then any interior elements are removed.

Difference

Geometry 2 is subtracted from geometry 1 (everything outside of geometry 2 is kept).

Output

Geometry

Standard geometry output.

Mesh to Curve

Converts a mesh geometry to a curve geometry.

Inputs

Mesh

Input mesh.

Selection

A selection of the input mesh.

Outputs

Curve

Standard curve output.

Mesh to Points

Converts a mesh geometry to a point geometry.

Inputs

Mesh

Input mesh.

Selection

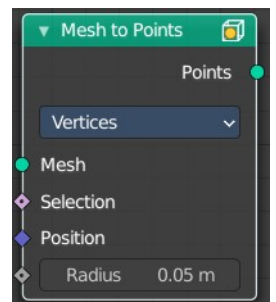

A selection of the input mesh.

Position

The position of the points.

Radius

The radius of the points

Properties

Mode

What geometry to convert to points.

Outputs

Curve

Standard curve output.

Mesh to Volume

Converts a mesh geometry to a Volume.

Inputs

Mesh

Input mesh.

Density

The density of the volume

Voxel Amount / Voxel Size

The voxel amount / the voxel size

Exterior Bandwidth

How much exterior bandwidth is calculated outside of the mesh. The larger the value the more unnecessary ray calculations happens.

Interior Bandwidth

Where to start the calculation inside of the volume.

Properties

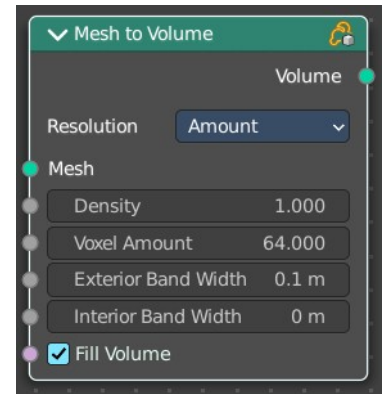

Resolution

How to calculate the volume. Based of the size or based at the amount.

Outputs

Volume

The volume output.

Sample Nearest Surface

Calculate the interpolated value of a mesh attribute on the closest point of its surface.

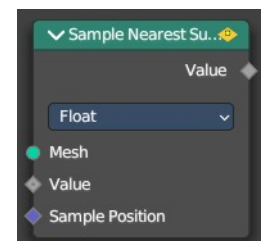

Inputs

Mesh

Input mesh.

Value

The value to calculate.

Sample Position

The sample position to calculate.

Properties

Data Type

Which data to calculate.

Outputs

Value

The output value.

Sample UV Surface

Calculate the interpolated value of a mesh attribute at a UV coordinate.

Inputs

Mesh

Input mesh.

Value

The value to calculate.

Source UV Map

The input UV map.

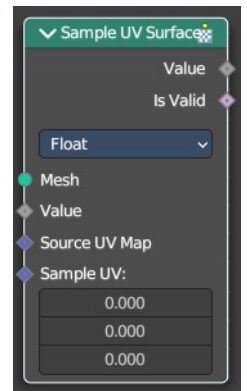

Sample UV

The sample position to calculate.

Properties

Data Type

Which data to calculate.

Outputs

Value

The output value.

Is Valid

Whether the node could find a single face to sample at the uv coordinate.

Split Edges

Splits the edges of the geometry.

Note that splitting edges breaks the mesh topology.

Inputs

Mesh

Input mesh.

Selection

A selection of the input mesh.

Outputs

Mesh

Standard Mesh output.

Subdivide Mesh

Subdivides the geometry by a simple division.

Inputs

Geometry

Standard geometry input.

Level

To which degree the geometry will be deformed.

Outputs

Geometry

Standard geometry output.

Subdivision Surface

The Subdivision Surface node subdivides the geometry using Catmull-Clark deformation.

Inputs

Geometry

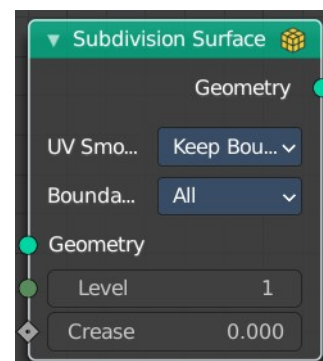

Standard geometry input.

Level

To which degree the geometry will be deformed.

Creases

Control how smooth edges should be with Weighted Edge Creases.

Properties

UV Smooth

The method to deal with smoothing the UV.

Boundary Smooth

Controls if open boundaries and corners are smooth.

Outputs

Geometry

Standard geometry output.

Triangulate

The Triangulate node triangulates all faces in a mesh.

Inputs

Geometry

Standard geometry input.

Minimum Vertices

Minimum number of vertices a face must have to be triangulated. For example, setting this value to 5, will prevent triangulation of Quads and only triangulate N-gons.

Properties

Quad Method

A quad is a polygon with four edges.

Beauty

Split the quads in nice triangles, slower method.

Fixed

Split the quads on their 1st and 3rd vertices.

Fixed Alternate

Split the quads on their 2nd and 4th vertices.

Shortest Diagonal

Split the quads based on the diagonal distance between their vertices.

Polygon Method

Meant are N-Gons. Faces with more than four edges. Tris, Quads and N-Gons are all Polygons.

Beauty

Arrange the new triangles nicely, slower method.

Clip

Split the polygons using an ear-clipping algorithm (gives similar results to the tessellation used for the viewport rendering).

Outputs

Geometry

Standard geometry output.

Scale Elements

Allows to scale the selected elements.

Inputs

Geometry

Standard geometry input.

Selection

A selection of the geometry.

Scale

The scale factor

Center

The center of the scaling.

Axis

Scale Mode Single axis only. Scale the selection separately along its single axis.

Properties

Domain

What kind of elements to scale.

Scale Mode

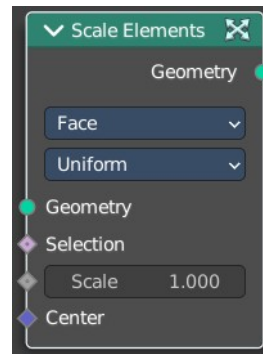

Uniform scales uniformly in all three world coordinates.

Single Axis scales separately in the single axis.

Outputs

Geometry

The output geometry.

Edge Angle

Calculates the angle in radians between two faces that meet at an edge. Without two faces on the edge, the angle will be 0.

Outputs

Unsigned Angle

The unsigned output angle. The shortest angle will be picked.

Signed Angle

The signed angle between the two faces, where Convex angles are positive and Concave angles are negative. This calculation is slower than the unsigned angle.

Edge Neighbours

Outputs the number of faces connected to each edge.

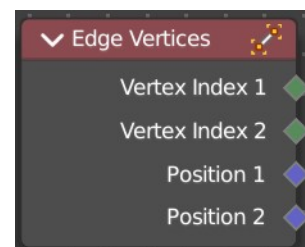

Outputs

Face Count

The number of faces.

Edge Vertices

Outputs the index and position of the two vertices that defines an edge. Index outputs an integer. Position a vector.

Outputs

Vertex Index 1

The index of the first vertice.

Vertex Index 2

The index of the second vertice.

Position 1

The position of the first vertice.

Position 2

The position of the second vertice.

Edges to Face Group

Group Faces into regions, surrounded by the selected boundary edges.

Inputs

Boundary Edges

The input edges.

Outputs

Face Group ID

The output face group.

Face Area

Gives each face area a unique id. Which can be used in a capture attribute for example, to create instances of other geometry to this now unique face areas.

Outputs

Area

The face area output.

Face Neighbours

Outputs the number of vertices or faces connected to each face.

Outputs

Vertex Count

The vertex count for the face neighbors.

Face Count

The face count for the face neighbors.

Face Group Boundaries

Find edges on the boundaries between face sets

Inputs

Face Set

The input face sets to calculate the boundaries from.

Outputs

Boundary Edges

The edges that lies on the boundaries between the different face sets

Face Count

The face count for the face neighbors.

Face is Planar

Returns true if all of the points of the evaluated face are on the same plane.

Inputs

Threshold

The threshold to consider the points to be at the same plane.

Outputs

Planar

True if the face is planar.

Mesh Island

Outputs a separate index for each mesh island. The indices are based on the order of the lowest-numbered vertex in each island.

Outputs

Index

The index output.

Is Shade Smooth

Retreives if the geometry is shaded smooth.

Outputs

Smooth

Smooth output.

Vertex Neighbors

Outputs the number of vertices or faces connected to each vertex.

Outputs

Vertex Count

The vertex count for the vertex neighbors.

Face Count

The face count for the vertex neighbors.

Shortest Edge Path

Calculates the shortest path from multiple start points.

Input

End Vertex

The last point of the path.

Edge Cost

The amount of calculation to find the shortest path.

Outputs

Next Vertex Index

The vertices index of the shortest path.

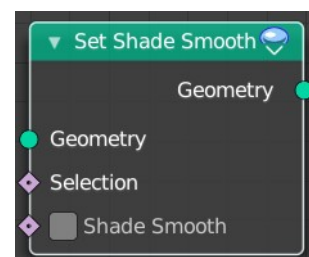

Total Cost

The calculation amount.

Set Shade Smooth

Retreives if the geometry is shaded smooth.

Input

Geometry

Input mesh.

Selection

A selection of the input mesh.

Shade Smooth

Set the shading to smooth.

Outputs

Geometry

Geometry output.
