Add menu - Output

Here you will find nodes to output the result.

Composite

The Composite node is where the actual output from the Compositor is connected to the renderer. This node is updated after each render, but also reflects changes in the node tree (provided at least one finished input node is connected).

Inputs

Connecting a node to the Composite node will output the result of the prior tree of that node to the Compositor.

Image

RGB image. The default is black, so leaving this node unconnected will result in a blank image.

Alpha

Alpha channel.

Z

Z depth.

Properties

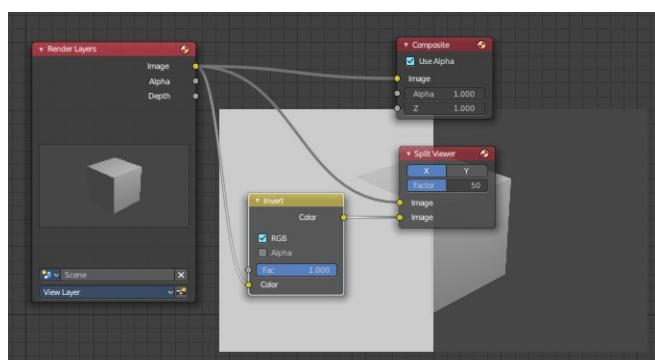

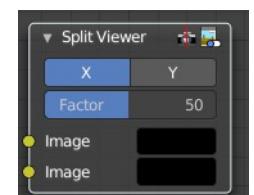

Use Alpha

Used alpha channel, colors are treated alpha premultiplied. If disabled, alpha channel gets set to 1, and colors are treated alpha straight, i.e. color channels does not change.

Note that if multiple Composite nodes are added, only the active one will be used.

Split Viewer

The Split Viewer node takes two images and displays them side-by-side as backdrop or as a Viewer Node output. This allows you to toy around with values in direct comparison to the original. Or to compare frames with each other.

Inputs

Image

The first image input

Image

The second image input

Properties

Axis

X tiles the images horizontal. Y tiles the images vertical.

Factor

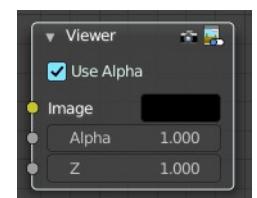

Percentage factor setting the space distribution between the two images.

Viewer

Displays the output as a backdrop in the viewport or in the Image editor. This allows you to inspect the outputs everywhere in the node hierarchy.

You can have more than one viewer nodes in the node editor. Just the output of the active Viewer node will be displayed. Click at a node to set it active.

When a Viewer node is selected, then the backdrop shows a widget cage that allows you to resize the backdrop image by its handlers.

Input

Image

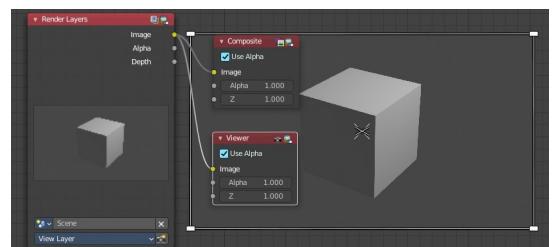

RGB image. The default is black, so leaving this node unconnected will result in a blank image.

Alpha

Alpha channel.

Z

Z depth.

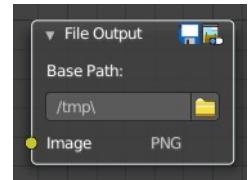

Properties

Use Alpha

Used alpha channel, colors are treated alpha premultiplied. If disabled, alpha channel gets set to 1, and colors are treated alpha straight, i.e. color channels does not change.

File Output

This node writes out an image as part of a frame set sequence. This happens for each specified frame range and specified to the entered filename.

This node can be used as a way to automatically save the image after a render; In addition, since this node can be hooked in anywhere in the node tree, it can also save intermediate images automatically.

Inputs

Image

The image(s) will be saved on rendering, writing to the current frame. An entire sequence of images will be saved, when an animation is rendered.

Note. To support subsequent arrangement and layering of images, the node can supply a Z-depth map. However, please note that only the OpenEXR image formats save the Z information.

Properties

Base Path

Unlike the render output file path, this node uses a base directory and an image name, by default the output path is composed of: {base path}/{file name}{frame number}.{extension}.

Besides being split into two settings, in all other respects, this setting is treated the same as the render output path.

File Format label

Shows the selected File Format.

You can find further export options in the sidebar in the Item tab in the Properties panel.
